

HyCAL Adds Paper Interleaf Capability for Coated and Surface Critical Product

(Gibraltar, MI) HyCAL Corp recently added a paper interleaf system to the recoiler on the company's 100% hydrogen continuous anneal line.

The paper interleaf is inserted between the laps of the coil as it exits the line, providing added protection for coated and surface critical products. The paper interleaf helps eliminate scratching during winding and from friction between the layers of the coil during transportation and storage.

The paper interleaf can be used on any coil but will primarily be used on coated product and/or surface critical product.

The paper interleaf is pH neutral and controlled for both sulfate and chloride levels.
